

## Introduction

**Lantek Integra Inventory** is a management solution that provides a real time view of all key information related to the quantity and valuation of inventory for each warehouse.

## Management of stock

This system makes available updated information for all elements involved in the products module: sheet metal, remnants, profiles, pieces, purchased products, finished products, and more.

The management of inventory, like material management, is specific for every type of product.

The remnants of sheet metal or profiles are generated and managed in the warehouse module after they have been designed in the technical office and have been validated in the workshop.

## Cost management

Once the chosen method for cost calculation has been selected (FIFO, LIFO or Average), the system updates the true costs of the products automatically and each time the user makes a warehouse movement from any

**Lantek Integra** module. This keeps information updated on the value of each stocked product and the overall value of the inventory.

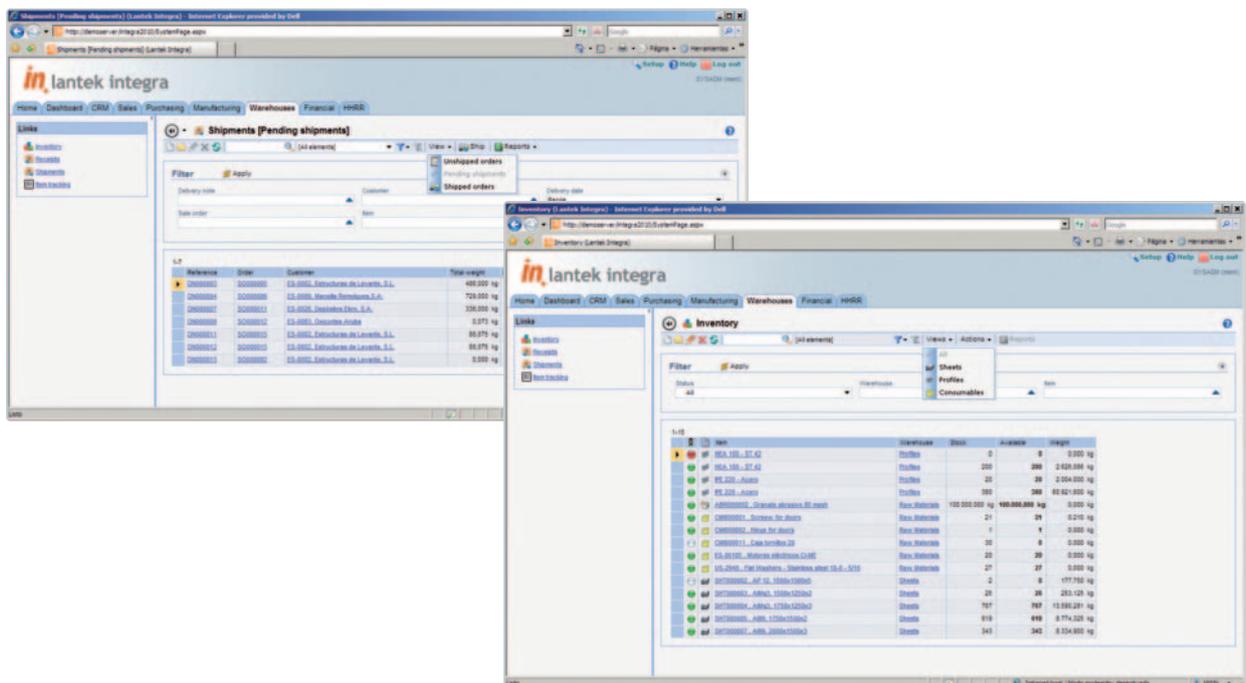

## Tracking management

**Lantek Integra Inventory** manages the tracking and serial or batch numbers for all received goods. The system can generate and assign serial or batch numbers when a product is received. It can also fix references and bar codes to received items and connect that documentation with any stock input-output.

## Stock and backlog management

The efficient management of warehouse materials and products requires an updated control of the inventory at any given time. **Lantek Integra Inventory** not only displays the quantities in stock; but, it also shows the status: available, reserved, orders pending, delivered.

For each material reservation, the system shows the origin and the reason for the material being reserved: dispatched for sales orders, workshop, manufacturing orders, and more. Finally, the system allows the creation of reservation tags to specify if an element is reserved.

## • Receipts and shipments management

The system manages all the receipts, both executed and pending. The system includes specific views to manage the received purchases and the pending purchases or receipts. This includes complete analogue shipment management with specific views for the management orders and for the pending and sent delivery notes.

## • Barcode Reader

The system is fully integrated with **Lantek** barcode solutions. This allows the registration of inventory movements, transfers, adjustments, and inventory look-ups by barcode terminals.

## • Multi-warehouse management

**Lantek Integra Inventory** allows the control of several warehouses at the same time, offering timely and accurate information on the quantity of product stocked in each warehouse as well as the overall quantity for all warehouses.

In addition, and for the optimum distribution of the products and their proper control, an option is also available for dividing the warehouses into different physical locations. The user has the ability to assign a warehouse to each product according to their characteristics.

*“Lantek Integra Inventory allows you to manage your warehouses and to reduce the required inventory costs to the minimum.”*

## • Compatibility of inventory with the other modules

**Lantek Integra Inventory** is totally integrated with the other management modules of **Lantek Integra**. Together, it becomes an effective system able to manage the true inventory and every other aspect of the company's requirements, such as: sales orders, manufacturing orders, CAD/CAM works, etc. The system is integrated and also connected with the **Lantek** CAD/CAM solutions software. It manages quantities and allocations for sheet remnants and for the profiles designed in the technical office in real time.

## • History and analysis of inventory

**Lantek Integra Inventory** may be used as a powerful analysis tool because it provides the Inventory Manager with the following information: history of warehouse movements, inventories executed between specific dates, generated receipts and documentation, economic valuation of the stock, and more. By using filters, it is easy to access the different classifications of invoices in a fast and intuitive manner.

### Main Characteristics of **Lantek Integra Inventory**:

- Total Inventory Management and Cost Valuation
- Tracking Management and Associated Documentation
- Stock and Backlog Management
- Receipts and Consignment Management
- Barcode Reader
- Integration with other areas
- History and Analysis of Inventory
